Table 1: Ecov parameter estimates, standard deviation, and rho for each EM for projection

EM Name	OM Ecov	Mean Ecov	Percent Change	Ecov Standard Dev.
AR(1)	-0.397	-0.481	21.159	0.191
Bad Projection	-0.397	-0.372	-6.297	0.139
Good Projection	-0.397	-0.281	-29.219	0.114
Historical Average	-0.397	-0.523	31.738	0.280
Recent Trend	-0.397	-0.279	-29.723	0.124
Recent Window	-0.397	-0.414	4.282	0.166
Terminal Year	-0.397	-0.488	22.922	0.202

```
## 'summarise()' has grouped output by 'EM_name'. You can override using the  
## '.groups' argument.
```

Figure 1: Estimated ecological covariates in for the different temperature projection choices in the EM compared to the “true” value in the OM.

Figure 2: Percent difference of the calculated recruitment per assessment year in each EM compared to the OM.

Figure 3: Percent of recruitment deviation explained by ecov in each model. NOTE WE ARE GETTING NEGATIVE SDS FOR NAA SIGMA RECRUITMENT SO RIGHT NOW IM ADDING RECRUITMENTS BUT IM SURE THAT IS WRONG. STILL LOOKING INTO IT

Figure 4: Percent difference of the calculated FXSPR reference point in each EM compared to the OM.
